START-UP CERTIFICATION FOR
SEASONAL NONCOMMUNITY PUBLIC WATER SUPPLY

Failure to submit certification is a violation of Act 399 and may subject the water supply to enforcement actions.

This completed form must be submitted to the local health department (LHD) PRIOR TO PROVIDING WATER FOR PUBLIC USE. All of the steps must be completed and deficiencies corrected prior to opening (keep a copy of the completed form for your records).

SUPPLY NAME:

WATER SUPPLY SERIAL NUMBER (WSSN):

ANTICIPATED OPENING DATE TO THE PUBLIC:

Details of the approved pre-opening start-up procedures can be found in the DEQ SEASONAL PUBLIC GROUNDWATER SUPPLY HANDBOOK.

If disinfected at the wellhead, Michigan registered well drilling contractor name:

8. Collected Two (2) Pre-Opening Bacteriological Samples 24 Hours Apart According to Sample Siting Plan | ☐   | ☐              | ☐                 |

Dates Bacteriological Sampling Completed:
(If using a private laboratory, it is your responsibility to submit the sample results to your LHD)

9. I certify that I have completed the above-listed tasks in accordance with the START-UP PROCEDURES FOR SEASONAL NONCOMMUNITY PUBLIC WATER SUPPLIES for system-specific LHD-approved procedure(s). The information on this certification is complete, accurate, and true to the best of my knowledge. Any deficiencies observed were corrected and details have been provided above.

Submission of this certification each year to the LHD before opening to the public is required under Act 399, referenced above.

Seasonally-operated noncommunity public water supplies must ensure the water is safe to drink before opening for the season. Follow the steps in the Michigan Department of Environmental Quality’s (DEQ) Start-Up Procedures before serving water to the public. The local health department (LHD) may require additional steps specific to a water supply system. Start-up procedures may be completed by the water supply owner or someone qualified to work on water supply systems, such as a Michigan registered water well contractor, licensed plumber, or a water supply certified operator. Detailed information on each step is provided in the DEQ SEASONAL PUBLIC GROUNDWATER SUPPLY HANDBOOK.

1. Evaluate the Wellhead and Surroundings
   Inspect the well for signs of damage – exposed wire, broken/loose cap, missing vent screen, or damage to the casing. Clear overgrown vegetation from around the well casing. Remove chemicals, fuel, or other potential sources of contamination from the well area.

2. Evaluate the Water System
   Check the pressure tank and supply lines for leaks/damage. Check electrical lines for damage. Clear the area around the raw water sample tap. Remove unnecessary items from well house/well equipment room. Drain stagnant water from the pressure tank. Verify that filters and treatment devices are clean and operating properly. Eliminate dead-end piping.

3. Evaluate the System for Cross Connections
   Verify that backflow preventers are on hose bibs, dump station towers, mop sinks, toilets, and ice machines.

4. Visually Inspect All Air Gaps and Backflow Preventers
   Make sure air gaps are appropriate. Look for leaks at backflow preventer devices and assemblies; replace if necessary.

5. Test Backflow Preventer Assemblies
   Assemblies must be tested at the appropriate frequency or no less than once every three (3) years by a certified tester.

6. Flush the Supply
   Flush the well and distribution system until the water runs clear. The longer the flushing time, the better. Avoid the septic system area.

7. Disinfect the Depressurized Portion of the System
   Disinfect the portion of the distribution system that was depressurized. A water supply owner may disinfect the distribution system using an approved positive displacement chlorinator or by pouring chlorine into a plumbing port in the well house or room. Only a Michigan registered well contractor can disinfect the well. Flush the system following disinfection until free of chlorine.

8. Collect Two (2) Pre-Opening Bacteriological Samples 24 Hours Apart
   Collect pre-opening sample from the distribution system, as identified in the sample siting plan, and collect another sample at least 24 hours later. These samples do not count toward routine monitoring requirements. If both sample results are non-detect for total coliform, continue to the next step. If a sample is positive for coliform or E. coli bacteria, contact your LHD for further instructions. Do not open your water system to the public.
9. Certify and Submit Start-Up Certification Form to LHD
Complete and sign the Start-Up Certification for Seasonal Noncommunity Public Water Supply form and submit it to the LHD with the two (2) consecutive non-detect bacteriological sample results before opening to the public.

Additional Information:

Hand Pump Wells
Hand pumps are not pressurized and are typically available for use year-round. If the hand pump is used seasonally, complete the start-up procedures and submit the start-up certification form to the LHD. Disinfection of seasonal hand pump wells is not required as part of a start-up procedure unless work was performed on the well.

Repairs/Service Work
Only a registered water well drilling contractor may chemically treat public water wells. Registered or licensed individuals may be required by law to perform work on the distribution system. Be sure to forward the details of specific work completed on the well or system to the LHD.

Pre-Opening (Special Purpose) Samples
Obtain non-detect results from two (2) consecutive pre-opening special purpose bacteriological samples according to the sample siting plan. This ensures the start-up procedures have eliminated potential contamination before serving water to the public. If coliform is detected, the water supply can correct the problem before opening and avoid triggering increased monitoring.

Sample Bottles, Forms, and Reporting
Water supplies that use the DEQ’s Drinking Water Laboratory (Lab) may call 517-335-8184 to order bottles. The Lab automatically notifies the LHD with the results if the report is completed accurately. Circle “9-Other” for “Sampling Purpose” on the laboratory water analysis form for the two (2), 24-hour-apart pre-opening samples.

Write the Water Supply Serial Number(s) on each water sample form. Deliver/send the bottle(s) to the Lab to ensure the sample can be processed within 30 hours of collection; otherwise, the result will be invalidated and the samples must be recollected and analyzed.

Private laboratories may be used, provided they are certified by the DEQ for drinking water analysis. Laboratory certification lists for total coliform, inorganic and organic contaminants, and lead/copper are available from the DEQ’s Web site at http://www.michigan.gov/deqlaboratoryservices. Be aware that most private laboratories do not report the results electronically to the DEQ; therefore, it is the owner’s responsibility to submit all analytical results to the LHD.

Questions regarding Seasonal Start-Up Procedures should be directed to your LHD. A Guide to Local Health Department Personnel can be found on the DEQ website.
